

ABSTRACT OF THE DISCLOSURE

A method and an apparatus for estimating the weight of horses. To estimate the weight of a horse, a girth, a length, and a height of the horse are measured. The measurements can be taken with commercially available measurement tapes, for example. The weight of the horse is then estimated based on the girth, the length and the height of the horse. The present invention will be utilized in the care and management of horses thereby resulting in advanced equine health and nutrition, better training results, and improved overall health monitoring.
